Executive Summary

The F. David Fowler Career Center at The George Washington University School of Business supports over 3,500 students and alumni through career development services such as advising, job search assistance, and networking. However, the center's current advising system, which heavily relies on manual processes and decentralized communication through Handshake and email, has led to inefficiencies including poor session continuity, ineffective counselor-student matching, and fragmented follow-up practices. To address these challenges, our team proposes an intelligent, AI-supported advising platform that enhances the existing Handshake infrastructure. The platform introduces dynamic student and counselor profiles, AI-powered matching algorithms, session tracking, structured action item management, and performance analytics through natural language processing. The proposed To-Be business process integrates real-time data sharing, personalized advising, and adaptive feedback loops to transform advising into a continuous, student-centered journey. Our database redesign includes normalized tables supporting key functions such as appointment management, feedback collection, and counselor performance evaluation. Implementation is supported by a full logical and physical database design, sample SQL statements, and queries to illustrate the platform's capabilities. This solution positions the Fowler Career Center to deliver scalable, high-impact advising experiences aligned with evolving student needs.

Section I: Business Problem

1.1 Description of Organization and Its Problems

Introduction of the Organization

The F. David Fowler Career Center is the dedicated career services office at The George Washington University School of Business. Established in January 2004, the center provides career development support to over 3,500 students and numerous alumni, equipping them with the necessary tools and guidance to navigate their academic and professional journeys (The George Washington University School of Business, 2025).

With a strong focus on career readiness, the Fowler Career Center offers a wide range of services, including career advising, job search assistance, resume critiques, interview preparation, and employer networking opportunities. By fostering meaningful connections between students, alumni, faculty, and employers, the center plays a crucial role in helping students secure internships and full-time positions aligned with their career aspirations (F. David Fowler Career Center, 2025).

In addition to its core career services, the center provides specialized resources such as career guides and online tools like VMock, which assist students in refining their resumes and cover letters. One of its key offerings is Fowler Finds, a dedicated job platform that connects GWSB students with exclusive internship and job opportunities across various industries, including consulting, finance, and marketing.

The Fowler Career Center serves a diverse group of stakeholders, including undergraduate and graduate students, alumni, and employers seeking to recruit top-tier talent from GWSB. Through its tailored approach to career development and industry engagement, the center remains a valuable resource for students looking to build successful and fulfilling careers.

Problem Context:

Currently, the Fowler Career Center relies on advising processes that are not data-driven, resulting in a largely manual and repetitive experience for both students and counselors (NACADA, 2022). Advising sessions lack continuity, and there is no formal system for tracking what occurs during meetings or following up on action items. Since counselors manage appointments with multiple students weekly, they rely on personal memory or scattered email threads to recall what was discussed in previous sessions. Action items and follow-up tasks are typically sent via email, and if students want feedback or clarification, they must book a new appointment with the same counselor. This process not only increases the number of redundant meetings but also ties up availability that could otherwise serve students with new or more urgent advising needs.

This inefficiency affects students who are navigating increasingly complex academic and career decisions. They must often wait for additional meetings simply to hear whether they are on the right track with prior guidance. Delays in receiving feedback can negatively impact time-sensitive decisions like applying for internships, refining resumes for job deadlines, or switching courses (Association of American Colleges and Universities, 2023). As the advising process becomes more fragmented, students may begin to disengage from the service entirely, attending fewer sessions or dropping off altogether (NACADA, 2022). This lack of continuity leads to missed opportunities and reduced advising satisfaction.

Counselors are equally impacted by these inefficiencies. Without reliable access to past session records, they must re-familiarize themselves with each student during every meeting. This repetition limits the depth and quality of each advising conversation and increases the cognitive load on counselors who must manage and recall large volumes of information across many students. The absence of a centralized record-keeping mechanism reduces the counselor’s ability to deliver personalized and informed guidance consistently.

A related but broader issue involves the lack of comprehensive student information at the counselor’s disposal. Most advising sessions are initiated based on resumes alone, which do not provide a full picture of a student's academic background, extracurricular activities, career interests, or personal strengths. As a result, counselors often use valuable session time to collect foundational information that could have been preloaded or referenced beforehand (Smith & Johnson, 2021). Without structured access to a student’s broader profile, the guidance provided risks being generic or mismatched to the student’s real goals.

Compounding this issue is the ineffective counselor matching process. Currently, students are asked to select a counselor based on short biographies that offer minimal detail about the counselor’s expertise, advising strengths, or industry knowledge (Smith & Johnson, 2021). There is no formal mechanism that matches students to counselors based on career focus, academic program, or specific advising needs. This often leads to misaligned pairings where students may be seeking specialized guidance in one area such as, transitioning into the tech industry, but end up meeting with a counselor whose background is in a completely different field such as finance or marketing.

These mismatches have a significant impact on student outcomes. Instead of receiving tailored, experience-based advice, students are left with generalized suggestions that may not support their intended direction. The problem is especially acute for students pursuing interdisciplinary or niche career paths, where matching with a knowledgeable advisor is critical. Counselors, on the other hand, face difficulty advising students outside their area of expertise, which can lead to frustration on both sides and an overall decline in advising effectiveness. This results in time lost, reduced confidence in the advising system, and in many cases, the student walking away without actionable next steps.

The effects of this problem are widespread. Students frequently report confusion or dissatisfaction following advising sessions that did not meet their expectations. Counselors are placed in positions where they must stretch beyond their core competencies, and the advising center as a whole loses its ability to provide targeted, high-impact career support. As academic and professional demands increase, the gap between what students need and what they receive through advising continues to grow.

Current Operations and its Inefficiencies:

The Fowler Career Center currently manages career advising appointments through Handshake, a widely used platform accessible to all George Washington University students, including those within the School of Business (George Washington University Career Services, n.d.). To schedule an appointment, a student logs into their Handshake account, navigates to the career center tab, selects the “Appointments” option, and chooses from a list of available categories such as resume reviews, mock interviews, or general career coaching. They are then directed to a calendar interface where they can browse available time slots based on counselor availability and select a preferred meeting format which is either in-person or virtual (Handshake, n.d.). As part of the booking process, students are prompted to fill out a text field titled “What can we help you with?” to briefly describe the purpose of their visit.

After submitting the request, the appointment awaits confirmation from the counselor. If the counselor approves, a confirmation email is sent to both parties. If the request is denied due to scheduling conflicts, the student is prompted to select a new time or a different counselor. Prior to the meeting, counselors frequently ask students to email them a copy of their resume or other relevant documents, even though much of this information may already be uploaded to Handshake. This practice introduces redundancy and extra administrative steps into the advising process.

During the advising session itself, the counselor typically reviews the student’s resume and relies on verbal input to learn more about their background, goals, and questions. Since students often arrive with limited context provided in advance and because counselors meet with many students throughout the week, much of the session is spent reacquainting with each student’s details rather than diving directly into tailored advice. This creates a fragmented advising experience in which each session must begin from scratch, regardless of whether the student has met with that counselor before.

Following the session, any action items or follow-up suggestions are typically shared via email. Students are expected to complete these tasks independently and then schedule a new meeting to receive feedback. However, there is no centralized mechanism for tracking these communications or monitoring student progress. As a result, students often have to remind counselors of their previous conversations, and counselors must manually search through past emails to recall what was discussed. This leads to inconsistent advising quality and places a burden on both parties to maintain continuity through informal, decentralized means.

The reliance on memory and email threads contributes to scheduling bottlenecks. Students who need clarification or brief feedback are required to book full advising sessions, which could otherwise be reserved for students with new or complex issues. The inefficiency becomes especially evident during peak advising periods, such as internship and job application seasons, when appointment availability is already limited.

Additionally, despite the presence of student profiles within Handshake, counselors often lack access to deeper, structured insights about a student's academic performance, extracurricular involvement, or career aspirations (Handshake, n.d.). The limited pre-session information reduces the effectiveness of early advising interactions. Compounding this is the lack of a formal counselor matching mechanism. While brief biographies are available on Handshake, they rarely provide sufficient detail to guide students toward the most relevant counselor for their needs. Furthermore, even when a student does identify a suitable counselor, mismatched availability often forces them to choose someone less aligned with their goals.

Altogether, the current operations reflect a disjointed advising system that lacks integration, personalization, and continuity. Both students and counselors face recurring administrative burdens, inefficient communication channels, and missed opportunities for timely, high-impact advising. As student needs continue to evolve, the limitations of the current process present a growing barrier to delivering effective career support.

1.2 As-IS Business Process Map

The current advising appointment process at the Fowler Career Center is managed through the Handshake platform, which is accessible to all George Washington University students (George Washington University Career Services, n.d.). The process involves three primary actors: the student, the Handshake system, and the Career Counselor (counselor). It begins when a student logs into Handshake using Single Sign-On, navigates to the "Career" tab, and selects the "Appointments" option. Handshake then populates appointment categories including resume and cover letter reviews, mock interviews, general career coaching, and networking guidance. The student selects the desired appointment type and may choose a preferred counselor, a date and time, and whether the meeting should be held in person or virtually. Students are also required to fill out a free-text field labeled “What can we help you with?” to provide context for the meeting. Once submitted, Handshake checks availability and routes the appointment request to the selected counselor for approval. If approved, the system confirms the booking and sends a confirmation email to both parties; if denied, the student is prompted to select a new time or counselor. Prior to the session, the counselor often contacts the student via email to request documents such as a resume or cover letter, even though this information may already exist within the student's Handshake profile (NACADA, 2022). The advising session then occurs according to the selected medium. Afterward, the counselor shares feedback and action items with the student by email. If the student needs follow-up or clarification, they must schedule a new appointment, typically with the same counselor, and reintroduce the details of the prior session. This reliance on memory and email results in a lack of continuity and introduces inefficiencies that affect both students and counselors (NACADA, 2022).

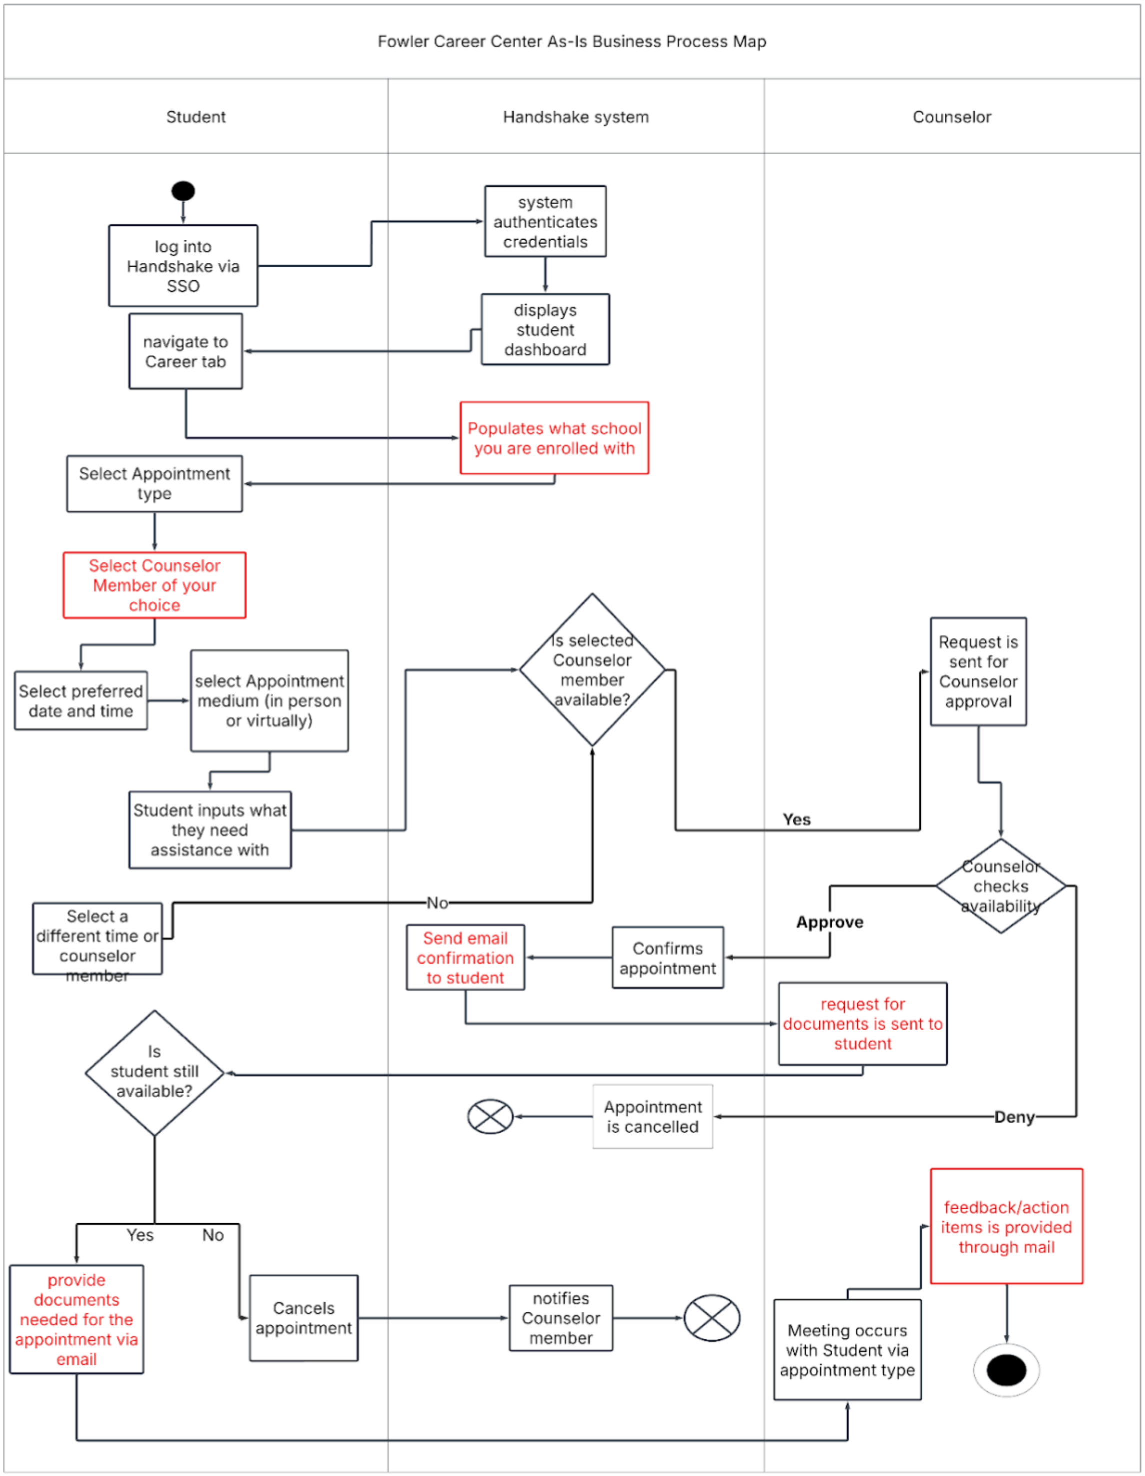

Figure 1. As-Is Business Process Map for Fowler Career Center Advising Process.

1.3 Conceptual Database Design (As-IS ERD)

The conceptual ERD for George Washington University's Fowler Career Center advising process consists of three core entities: Student, Counselor, and Appointment. This structure models the center's current use of the Handshake platform, which facilitates appointment scheduling but does not serve as a data-storing entity and is therefore not part of the ERD (Handshake, n.d.). The Student entity represents all students eligible to schedule advising appointments. Each student may book multiple appointments during their academic journey. Attributes typically include StudentID, Name, Email, and Program.

The Counselor entity represents the pool of available counselors. A counselor may handle multiple appointments with various students. Attributes include CounselorID, Name, and Email. The Appointment entity serves as an associative entity linking students and counselors. Each appointment is associated with exactly one student and one counselor. The appointment captures attributes such as AppointmentID, StudentID, CounselorID, AppointmentType, Date, Time, Mode (in-person or virtual), and Status (confirmed, pending, or denied) (Coronel & Morris, 2019).

The relationships are defined as follows: a student may have multiple appointments over time (1:M), and a counselor may conduct multiple appointments with different students (1:M). Appointments are treated as isolated events without advising history, counselor specialization data, or centralized feedback records.

This simple model reflects the advising system's current limitations and provides the foundation for future improvements proposed in later sections.

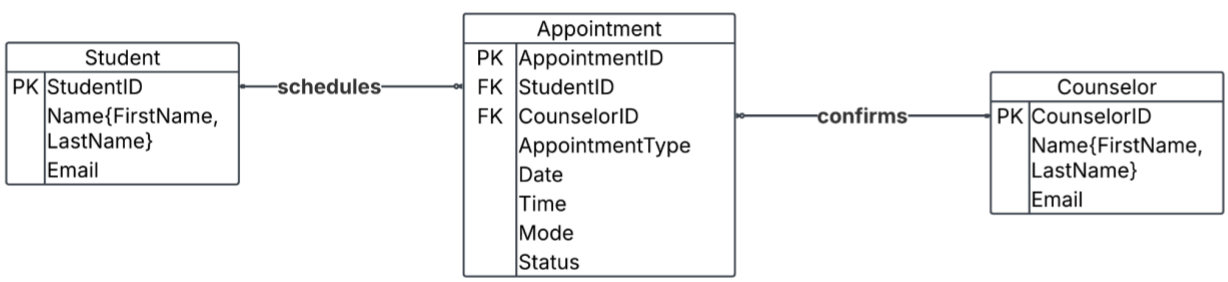

Figure 2. As-Is Entity-Relationship Diagram (ERD) for the Fowler Career Center Appointment Scheduling Process

Section II: IT-Based Solution Development

2.1 Description of IT-based Solution

Our proposed IT-based solution is an intelligent, centralized advising platform for the Fowler Career Center that is designed to streamline advising operations, improve student-counselor matching, and ensure that there is continuity across multiple advising sessions. The new system combines data-driven features, artificial intelligence, and user-centric design to resolve existing inefficiencies in the advising process (EDUCAUSE, 2023). This system integrates with the current appointment scheduling system built into Handshake by adding advanced functionality layers that deliver personalized, high-impact career guidance.

At its core, the solution creates a dynamic ecosystem that connects students and counselors through structured data inputs and AI-supported processes. Students will build comprehensive digital advising profiles by uploading transcripts, resumes, and logging their extracurricular involvement, work experience, and up to three career interest areas. These profiles will be continuously updated and accessible to counselors, enabling more informed, tailored advising sessions. Counselors, in turn, will develop detailed profiles that highlight their professional background, industry expertise, preferred advising areas, certifications, and availability. This transparency will empower students to make better choices when selecting counselors, and it allows the system to function as an intelligent matchmaker (NACADA, 2022).

A key innovation is the AI-powered Matching Module, which analyzes both student and counselor profiles to recommend optimal pairings based on interests, career goals, and advising needs. While students can follow these recommendations, they also retain autonomy by being able to browse through available counselor profiles and select whoever they prefer to have an appointment with (EDUCAUSE, 2023).

To prepare counselors before each session, the system generates a customized AI-Generated Advising Summary that compiles a student's academic trajectory, professional ambitions, listed interests, and past advising history. This ensures that counselors begin each session with context, leading to saving time and increasing the depth of the conversation.

After each session, a dual-purpose Session Tracking and Feedback System will support both internal documentation and student-facing follow-up. Counselors can record what occurred during the session including insights shared, challenges discussed, and guidance they offered using multiple formats such as text, audio, or video (Smyth & Anagnostopoulos, 2021). This feature ensures accurate records for future reference, especially when the student returns after an extended period or transitions to a different advisor. At the same time, the system will allow counselors to issue clearly defined action items for the student, including what to do next, how to do it, and any materials or deadlines involved. This replaces the current email-based follow-up system, which often leads to lost information or unclear expectations. Students can view these instructions within the platform and track their completion status with clarity.

To reduce rescheduling and enhance follow-through on action plans, the platform allows counselors to assign personalized Action Items after each session. These tasks, which may include specifics on resume improvements, areas to prepare for mock interviews, or improving cover letters for a mock job description, will be visible to both the student and counselors who will work with the student on their needs. If the original counselor is unavailable for a follow-up, the system will suggest alternative counselors who are both qualified and available. The selected counselor can review the completed action items, determine whether the student has met the expectations, and either recommend new resources or update the task list. If the student fails to meet the action item requirements after two attempts, the lecturer will then prompt them to book another session for more hands-on support. The Internal Advisor Comments system will be expanded not only to document successful advising engagements, but also to include notes on incomplete or unsuccessful sessions (NACADA, 2022). These insights will help any subsequent counselor quickly understand where the student left off and what interventions might be necessary.

To further strengthen the system's intelligence and adaptability, students will be encouraged to submit session reviews, rating their advising experience and optionally providing comments. These reviews will directly feed into the AI's matching criteria: for instance, if an ISTM student rates a counselor highly for their industry-specific guidance, the system will learn to prioritize that counselor when future ISTM students seek support (EDUCAUSE, 2023). Over time, this will lead to increasingly accurate and impactful advisor-student pairings.

In addition, the platform will periodically generate Performance Reports for counselors, summarizing student feedback trends, advising strengths, and areas for improvement making use of natural language processing to extract themes from qualitative comments (Hirschberg & Manning, 2015). These reports will serve as constructive tools for professional development, enabling counselors to refine their profiles, adjust their advising topics, or realign with student populations where their impact is strongest.

This IT-based solution not only resolves the problem of fragmented advising experiences but also positions the career center to offer scalable, personalized, and future-ready advising. It enhances satisfaction for both students and counselors, while promoting accountability, data-driven decision-making, and continuous improvement.

2.2 To-Be Business Process Map

The proposed To-Be business process introduces a centralized, AI-supported advising platform that significantly enhances the way students and counselors engage within the existing Handshake infrastructure. The To-Be process is designed to address key inefficiencies identified in the As-Is process by improving counselor-student matching, streamlining document and feedback management, and ensuring continuity between advising sessions (NACADA, 2022).

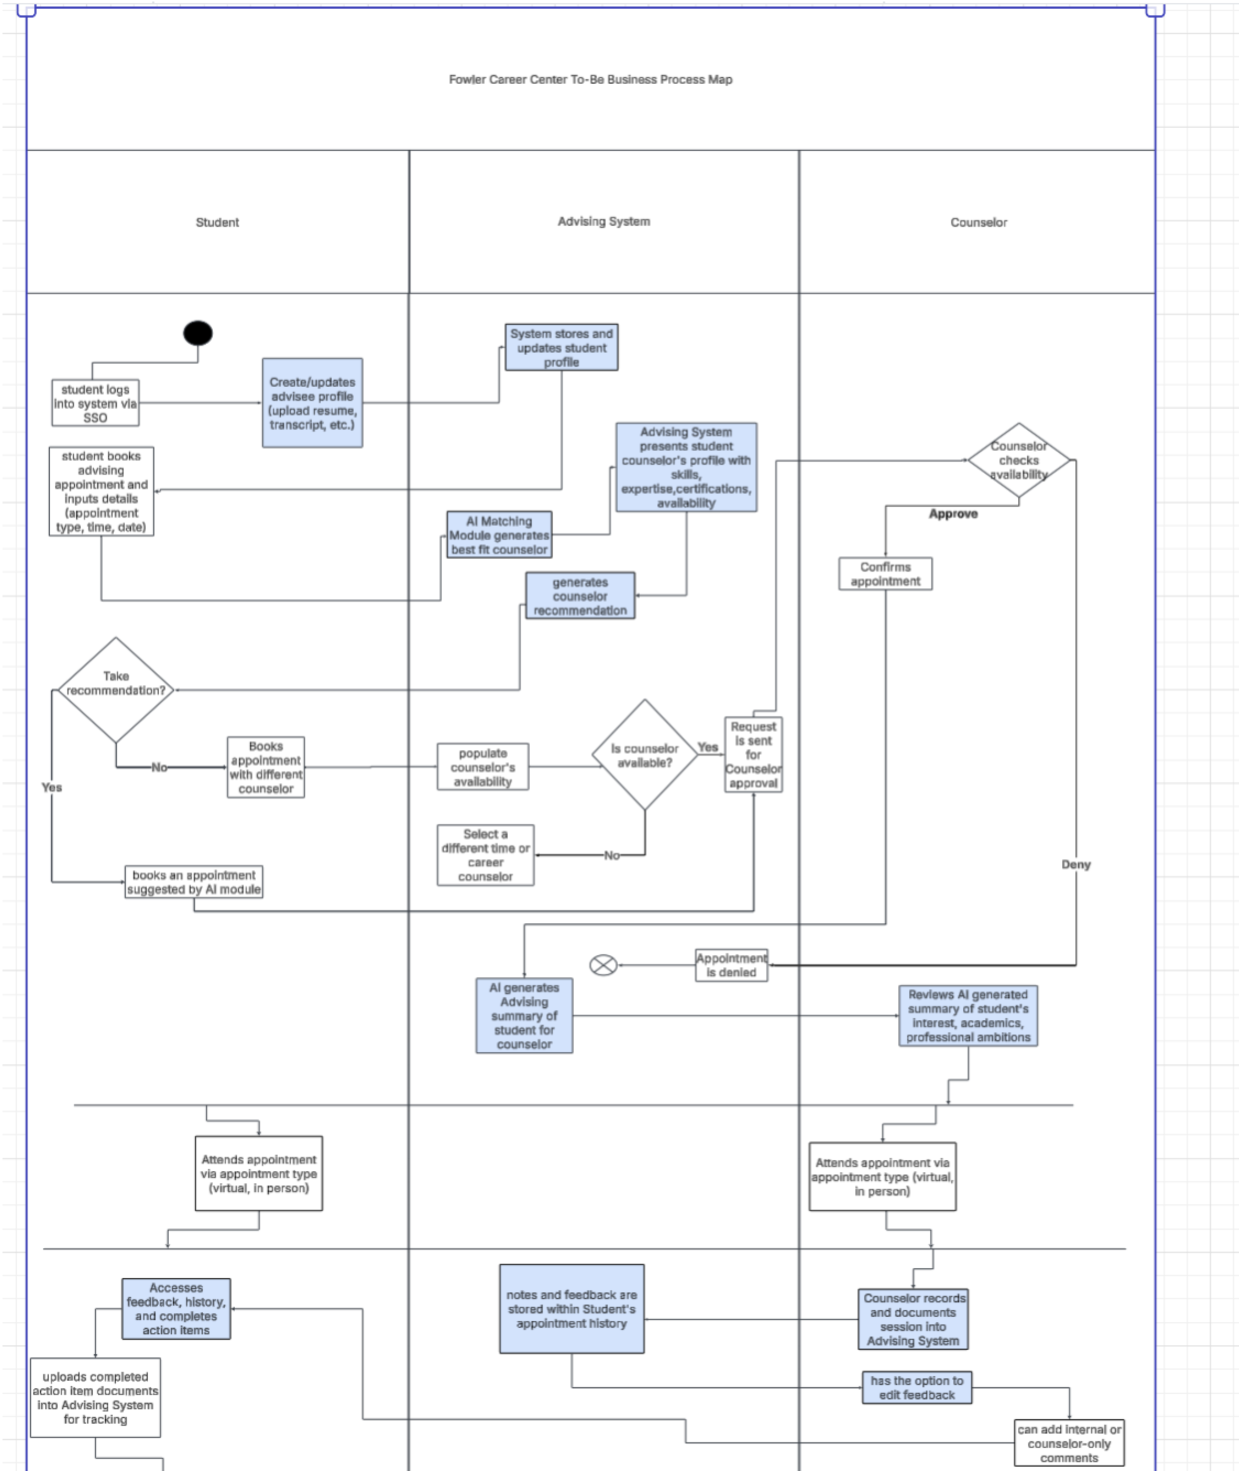
In the current As-Is process, advising appointments are scheduled through Handshake, where students select appointment types and time slots based on counselor availability. The interaction relies heavily on email communication, before and after appointments, for sharing documents, issuing feedback, and confirming expectations. This results in several pain points, including redundant outreach from counselors requesting documents that already exist in Handshake, fragmented communication channels, and the absence of a centralized record of session notes or student progress (NACADA, 2022). As a result, students often have to restate their issues in follow-up sessions, and counselors lack sufficient context to deliver high-impact advising efficiently.

The To-Be process replaces these gaps with a fully integrated advising platform that overlays intelligent functionality on top of the existing Handshake system. Students begin by creating rich advising profiles that include uploaded documents and declared career interests. When requesting an appointment, students are matched to counselors using an AI module that evaluates both student needs and counselor expertise (EDUCAUSE, 2023). Unlike the current free-text based matching approach, this automated system delivers more accurate and relevant pairings, while still allowing students to choose their preferred counselor.

Once an appointment is booked, the system generates an AI-driven Advising Summary for the counselor, drawing from the student's academic history, prior sessions, and uploaded materials. During the appointment, counselors can document session highlights and insights internally within the system rather than relying on memory or email trails. After the session, they submit structured feedback and action items directly through the platform, replacing informal email communication. These action items are now trackable and visible to both students and other qualified counselors, which supports better follow-up and reduces the need to rebook appointments with the same individual counselor (Smyth & Anagnostopoulos, 2021).

Furthermore, the system enables the selection of alternate counselors for reviewing completed action items if the original counselor is unavailable. Internal advisor comments and session logs improve cross-counselor coordination and minimize repetition. Students are also invited to rate each session, and their reviews help refine the AI matching process over time (EDUCAUSE, 2023) while feeding nto performance reports for counselors. These reports highlight advising strengths and improvement areas, fostering counselor growth and strategic adjustments to advising focus (Smyth & Anagnostopoulos, 2021).

In summary, the To-Be process resolves the issues of fragmented communication, poor session continuity, and inefficient matching present in the As-Is system. By introducing AI-supported personalization, integrated documentation tools, and data-driven feedback loops, the new process transforms advising from a one-time interaction into a continuous, adaptive support system for students throughout their academic journey.



Fowler Career Center To-Be Business Process Map
Student
Advising System
Counselor
student logs into system via SSO
Create/updates advisee profile (upload resume, transcript, etc.)
System stores and updates student profile

Student provides rework of advice
AI generates counselor with score of how well the student completed second rework
AI generated summary is written and sent to Counselor
Counselor reviews summary, submitted document and student submission
Did student meet requirements of successful advising?
No
YES
NO
NO
Yes
Student receives feedback and takes further action
Session is closed and document is generated to be attached to next appointment
Adds internal or counselor only comments
Yes
Student submits review score and comments
Student restarts process
Suggests student to book a new in person or virtual appointment
No

Figure 3. To-Be Business Process Map for Fowler Career Center Advising Process.

2.3 Conceptual Database Design (To-Be ERD)

The proposed database supports the intelligent advising platform outlined in the To-Be business process by introducing new entities and relationships that reflect the expanded roles of students, counselors, and system-driven feedback. Unlike the As-Is system, which lacks centralized data capture and continuity, this design enables real-time data sharing, performance tracking, and adaptive personalization (Smyth & Anagnostopoulos, 2021). The Entity Relationship Diagram (ERD) includes core entities such as Student, Counselor, AppointmentSession, Feedback, and ReviewLog, and introduces supporting structures like AIMatchRecommendation, PerformanceReport, and FileUpload. These components provide the data backbone necessary to power AI-based matching, track advising performance, and facilitate cross-session continuity (EDUCAUSE, 2023).

The conceptual model is structured to meet both user-facing and system-processing needs. Data normalization is applied through multivalued attribute decomposition, such as splitting Skills and CareerInterests into separate entities in the logical design (Coronel & Morris, 2019). This enables flexibility and scalability as new feedback types, performance metrics, and student document types are added.

5Cs – Information Requirements

Captured:

The system captures detailed student information including uploaded resumes, transcripts, skills, and up to three selected career interests. Counselors also submit their areas of specialization, certifications, industries of expertise, and preferred advising topics. During and after advising sessions, counselors capture session summaries, internal notes, and structured action items for students. Students, in turn, capture feedback through session reviews and ratings (Smyth & Anagnostopoulos, 2021).

Conveyed:

Key outputs conveyed to users include AI-generated counselor recommendations, advising summaries, action item lists, and system-suggested follow-up counselors (EDUCAUSE, 2023). Students also receive access to feedback, session history, and real-time progress tracking. Counselors are conveyed performance reports that summarize their effectiveness based on student ratings and feedback trends.

Created/Processed:

The system generates personalized Advising Summaries before each appointment, creates Feedback entries after sessions, and periodically produces counselor Performance Reports (Smyth & Anagnostopoulos, 2021). It also processes student reviews and match outcomes to refine the AI Matching Module over time using a continuous feedback loop.

Cradled/Stored:

The database stores advising profiles, appointments, action item history, session documentation, counselor reviews, and performance metrics. Session notes and internal comments are stored for continuity and used by multiple counselors across advising sessions. File uploads, such as resumes and transcripts, are preserved and linked to student profiles for future advising or analysis (Coronel & Morris, 2019).

Communicated:

The platform communicates data between the advising interface, the AI Matching Module, and the scheduling backbone (Handshake). Appointment approvals, counselor availability, and student feedback are shared between system components in real time. Additionally, AI-generated recommendations and performance insights are pushed to relevant users and modules (Smyth & Anagnostopoulos, 2021).
